CHALLENGE

Getting a new home is always a big deal, and making it suit your lifestyle is equally important. Jim's new house needed a space that would accommodate his Harley, bring out its wow factor, be easy to maintain and be the perfect escape spot to have a beer with his friends and family. Here's what the job required:

- It was imperative to complete the job in a timely manner – he did not want to leave the motorcycle sitting outside for too long.
- Having a professional system and not a big-box store paint installed was also important. Jim was at the point in his life he didn't want to mess with low-grade products that wouldn't last, looked cheap and simply didn't perform.
- Easy to clean and keep looking clean
- The garage faced the south and was open often so having something that was UV stable was important.

SOLUTION

One Day Flake System has been a proven system for garage floors and other areas where a seamless floor is desired that can be used quickly after installation. This system is a favorite for garages and commercial applications.

- Done in one day. The contractor ground the floor with a concrete grinder to create a great profile. Metal bond concrete grinding tools and a vac system were used and the floor was

dry ground so it could be installed the same day. After proper prep the base coat of Poly 90 was put down and our Epoxy Color Flakes were added for texture and color. A lunch was taken by the installer then the clear coat was installed. Later that evening the floor was open to light foot traffic!

- The Poly 90 product is in the same family of products as truck bed liner! This product is a professional coating not a paint like you would find at the big box store. Many professionals use this product as part of their daily installations.
- One of the easiest floors to clean. Run a microfiber mop or pour some water and squeegee. It stays looking clean as the flakes hide dirt.
- The UV stability of the product allows it to take extreme sunlight. Epoxies like the big-box stores sell are most all epoxies that will amber and turn yellow as time goes on.
